

Cooling tower application - AquaKLEAR P100

Customer: Milan Federal Correctional Institution, Michigan, USA

Dealer: Electro-Matic Products Inc., Michigan.

On August 10th, 2010, an AquaKLEAR P100 unit was installed on the 4" cooling tower return water line. Opposed to the manufacturer's recommendation, the water softening system was not disconnected due to the customer's concern the unit will not perform as advertised.

Initial water tests:

Conductivity - 2800
Calcium - 300 ppm
Bacteria - 1000 colony forming units/mL

Water tests 72 hours after installation:

Conductivity - 3200
Calcium - 340 ppm
Bacteria - 0 colony forming units/mL

Calcium and conductivity levels rose slightly showing that calcium was being removed from the surface of the equipment and dispersed into the water column. Additionally, the bacteria levels dropped to an undetectable level.

"Innovations that put nature to work for you!"

Before

After

Heavy corrosion has been removed from steel and a protective dark gray layer of magnetite is beginning to form

Before

After

All white colored calcium deposits have been removed from interior of the 4" pipe.

"Innovations that put nature to work for you!"

Summary:

In the past the tubes would have to be cleaned twice a cooling season if the water softening equipment failed or was inoperable. It appears that the P100 system is having a positive impact on the water quality issue, removing not only calcium and corrosion but also prohibiting the ability for bacteria to grow in the water column.

The estimated projected savings for this piece of equipment per cooling season (7 months) is **\$3,500.00** in salt, **\$500** in chemical cleaning materials and **155,000 gallons (\$250)** of water between backwashing softening equipment and blowing down due to total dissolved solids in the water column.
